

FAQ

What is IV Therapy?

IV Therapy is a lifestyle for everyone. Vitamin drips infuse your body with pure vitamins, hydration & electrolytes, directly into the bloodstream for full absorption. When you need a little boost to heal or feel better, our shots and drip infusion formulas can be just what you need. Our infusions help to prevent a cold or flu, regain your energy and mental focus, boost your fat and calorie burning power, and help rebuild muscles for athletic performance.

Why get an IV?

Vitamin drips are much more effective than taking oral supplements by bypassing GI tract, allowing for greater absorption. By using this method, we can safely deliver larger doses that would otherwise not be fully distributed or tolerated orally. Each IV Drip provides highly concentrated combinations of vitamins based on parenteral micronutrient therapy science. IV Drips consist of all natural bio-identical vitamins and nutrients that are naturally found in our body and in organic foods we consume. The result? An instant, noticeable improvement in overall body and mental function.

What are the benefits?

- 100% ABSORPTION
- BOOST YOUR MOOD
- DESTRESS & RELAX
- BOOST IMMUNE SYSTEM
- REHYDRATION

- PREVENT ILLNESS
- INCREASE ENERGY
- CURE A HANGOVER
- REBUILD MUSCLES
- INCREASE ATHLETIC PERFORMANCE
- ANTI-AGING

Who can benefit?

IV Vitamin Therapy is great for anyone looking to experience rehydration and wanting to improve his or her overall health and wellness.

What is in the IV bag:

The drips are in uniform with the IV's you would find at your local hospital. We carry and administer the same hospital-grade ingredients, supplies, and equipment with all our drips, boosters, and shots. We only use first-rate vitamins, minerals, and amino acids from certified pharmacies.

How does it work?

The use of an IV bypasses the digestive system, which allows for 100% absorption of vitamins, minerals, amino acids and antioxidants.

How long are IV nutrient therapy drips?

It varies. Most of our drips take anywhere between 30-45 minutes, depending on your specific treatment of choice. Our boosters and shots are conveniently added to the drips or administered directly to the patient. This process adds little to no time to the total drip. Your hands will be free so you can relax, listen to music, read or do your work while you receive your IV nutrient therapy. Feel free to bring your device and headphones.

Is it safe for children?

While IV therapies are safe for kids, our drip blends are designed for adults.

How long does IV Trip therapy last?

After an IV infusion, the vitamins remain in your system and maintain your levels for 2-3 weeks because it is absorbed directly into your bloodstream and bypasses the GI tract. One IM (intramuscular) vitamin booster shot is equivalent to taking one week's worth of oral vitamin supplements.

Are infusions most effective before, during, or after partying, illness, stress, or events?

All of the above. Our drips are designed to prepare, as well as replenish your body from the strenuous activities you put it through. The vitamins and minerals in our IV's will help with cellular rejuvenation and advanced recovery. Whether you are feeling under the weather, fatigued from overexertion or jetlag, or depleted from a night of overconsumption, we are here to help!

Does it hurt:

Infuz cares immensely about our patients' wellness and comfort. We have an amazing team of registered nurses (RN), and Physicians (MD). We use small, delicate needles and a localized numbing agent (upon request) to provide a relatively pain-free experience. In any event, everyone's pain threshold is different. While most find it painless, others may feel brief discomfort upon needle insertion. Generally, patients find the infusion itself quite relaxing.

What results should I expect:

Almost instantly, most of our patients notice an increase in energy and an overall enhanced health boost. Optimum vitamin and mineral levels support proper metabolism, cortisol levels, cellular health, mood, and good sleep patterns. Our drips and boosters can also give your immune system a huge boost.

How soon will I see results?

Effects can be felt immediately and results last anywhere from several days to several weeks.

Can I resume my activities after a drip?

Yes, you can resume your normal daily activities after your drip. In fact, your day just got that much better!

How often should I have an IV Drip:

The frequency of IV Drip therapy is determined on a patient by patient basis, we take a customized approach to suit your individual needs. For preventative health and wellness, we recommend two IV drips per month to help balance out any vitamin deficiencies.

SIDE EFFECTS:

There are no specifically reported side effects. Almost anyone can use IV fluids for hydration. Caution is advised in those with known congestive heart failure, renal failure, or liver disease. Please notify staff if you have a rare previous allergy to any vitamins or micronutrients.
